

Background

- Strategies in developing an integrated health system specialty pharmacy (HSSP) patient management program (PMP) vary widely, ranging from generalized approaches to tailoring disease-specific programs.
- The complexity of specialty medications and evolving accreditation and third-party payer requirements highlight the need for disease-specific PMPs.
- These PMPs include disease states that require complex dosing regimens or frequent lab monitoring.
- Development of a disease specific PMP ensures high quality patient-centered care.

Objective

- To establish a systematic approach for further developing and expanding disease-specific programs within an integrated HSSP.

Methods

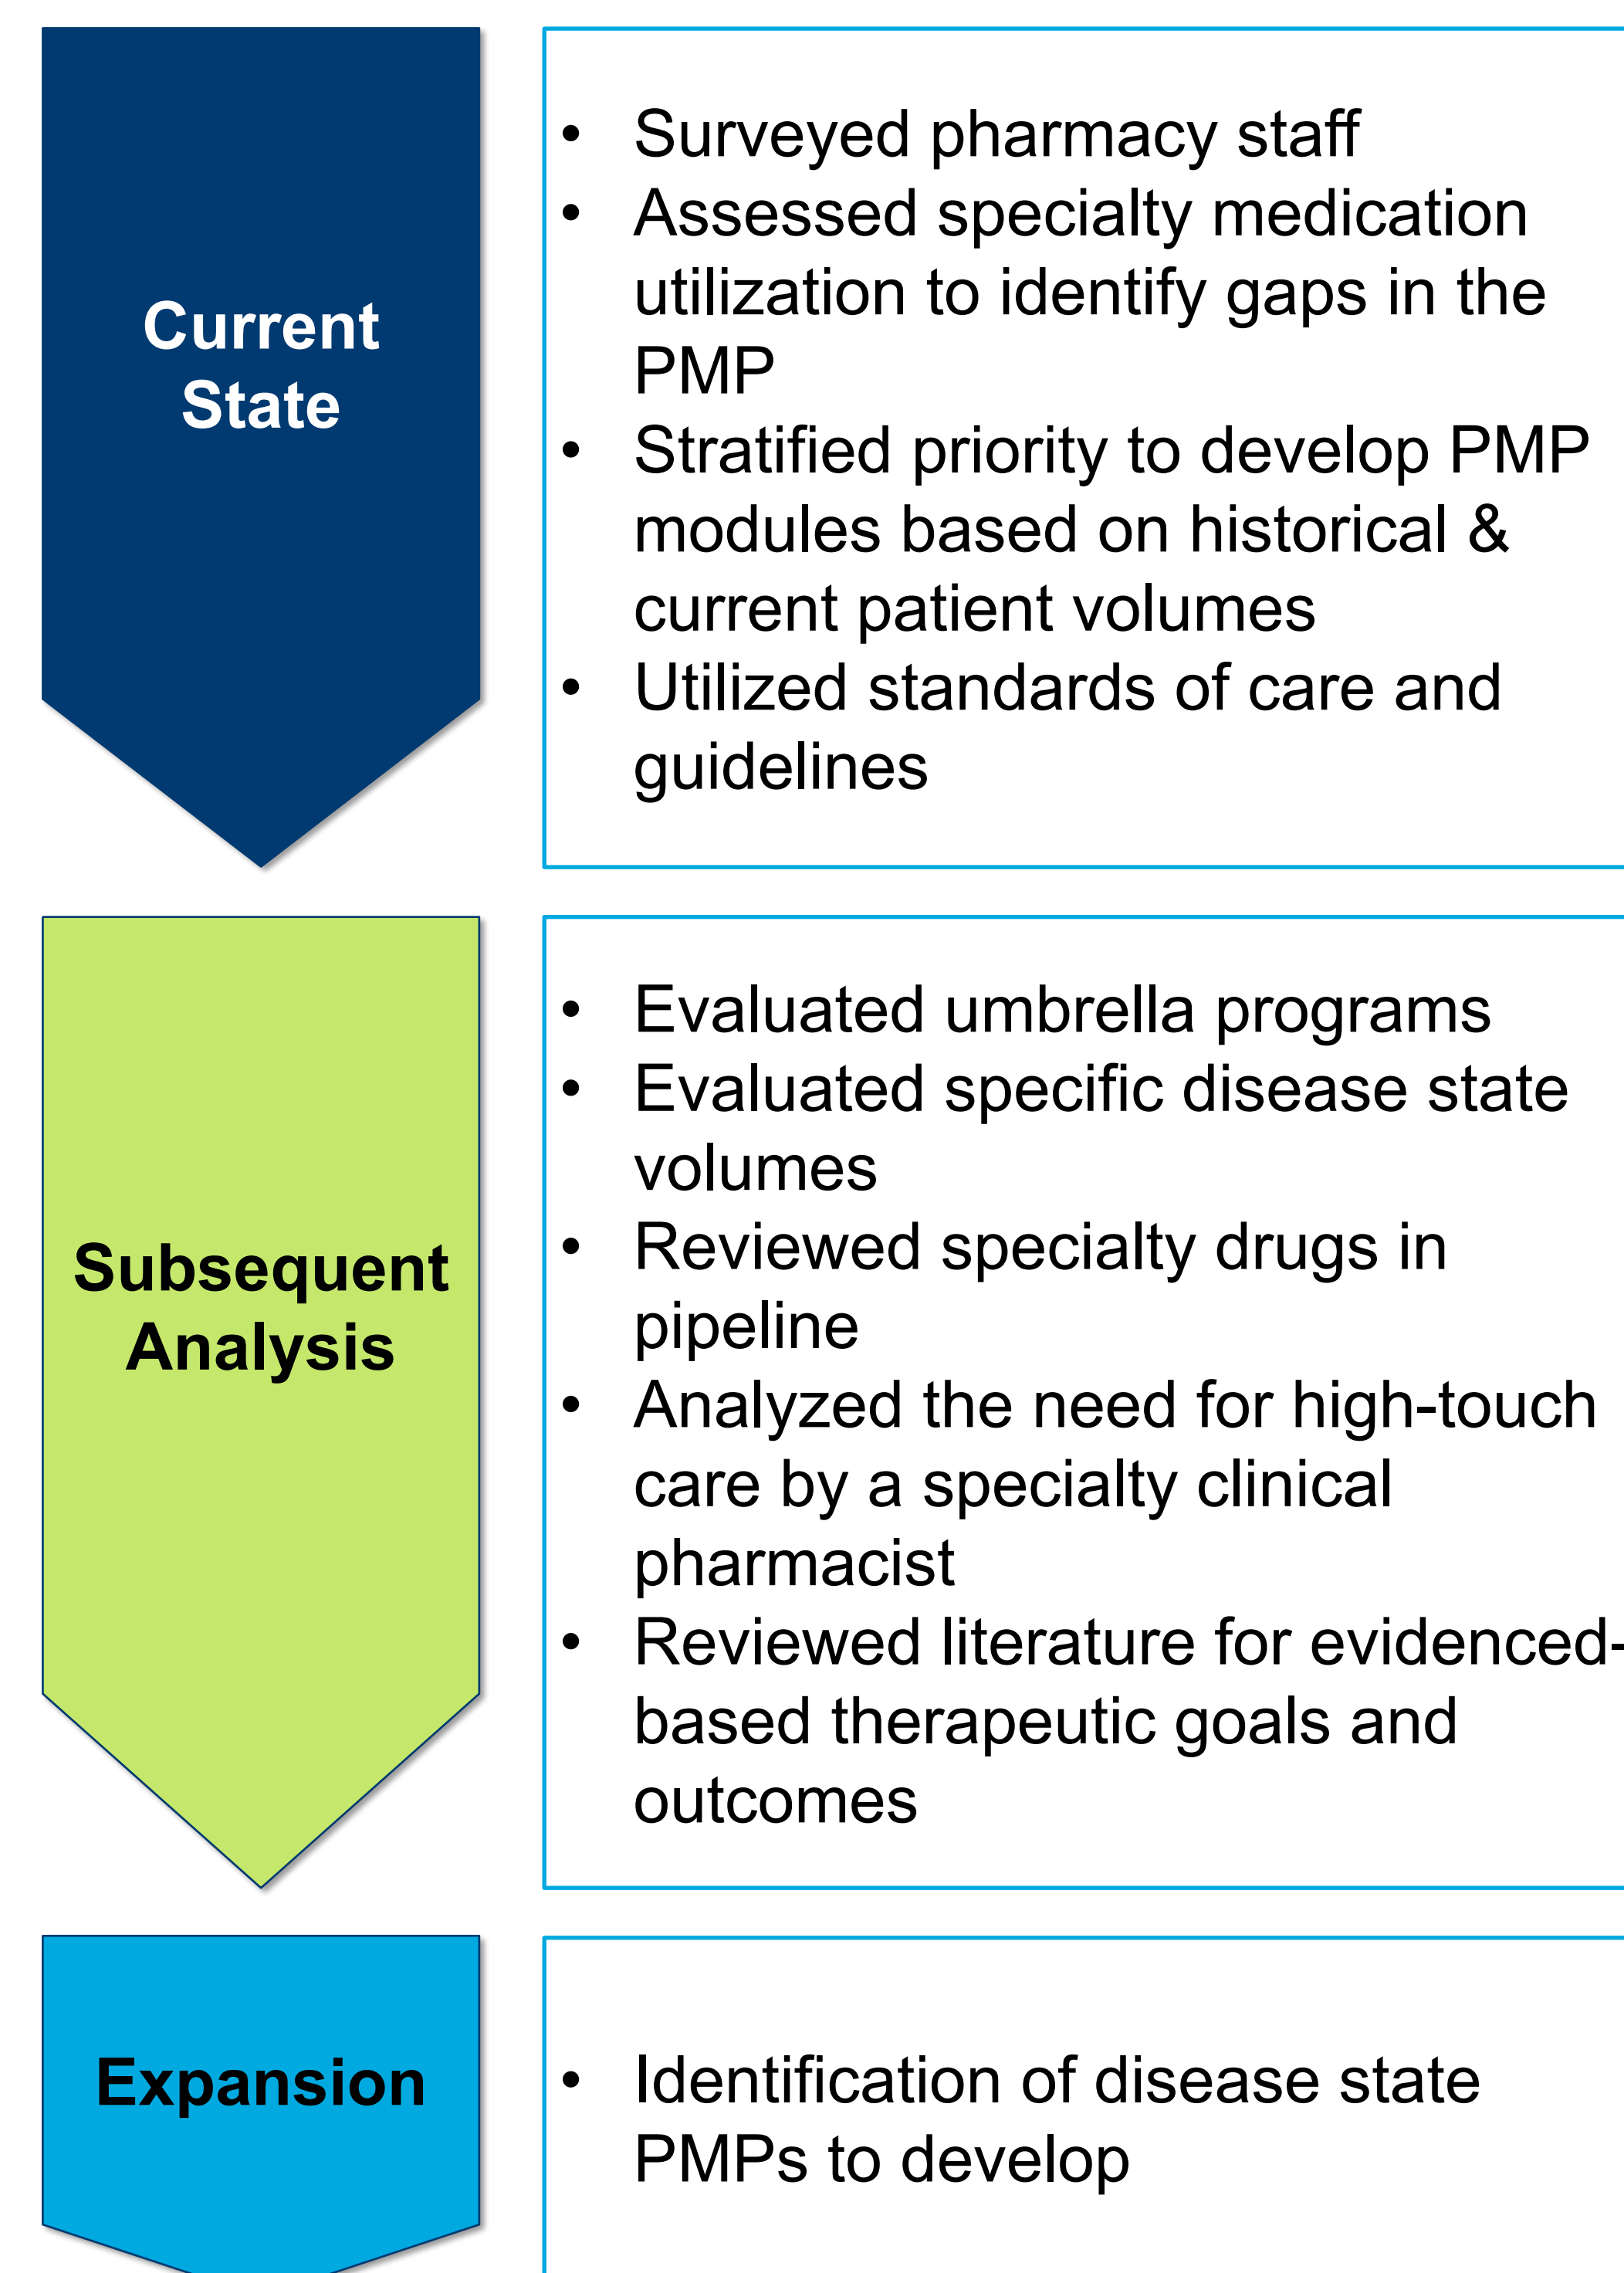

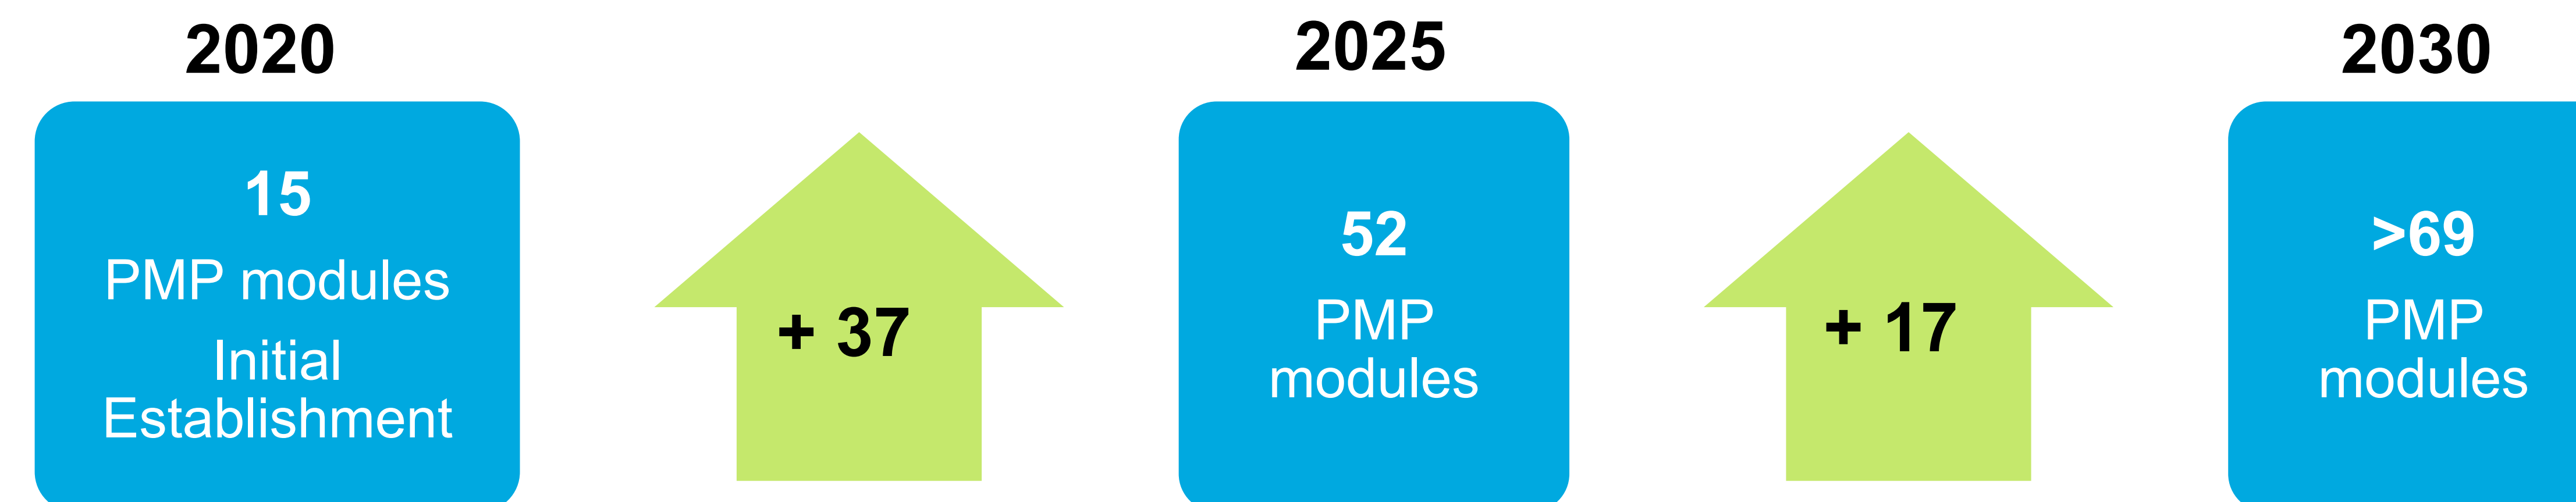

Figure 1: PMP Growth

Results

Figure 2: Analysis Workflow

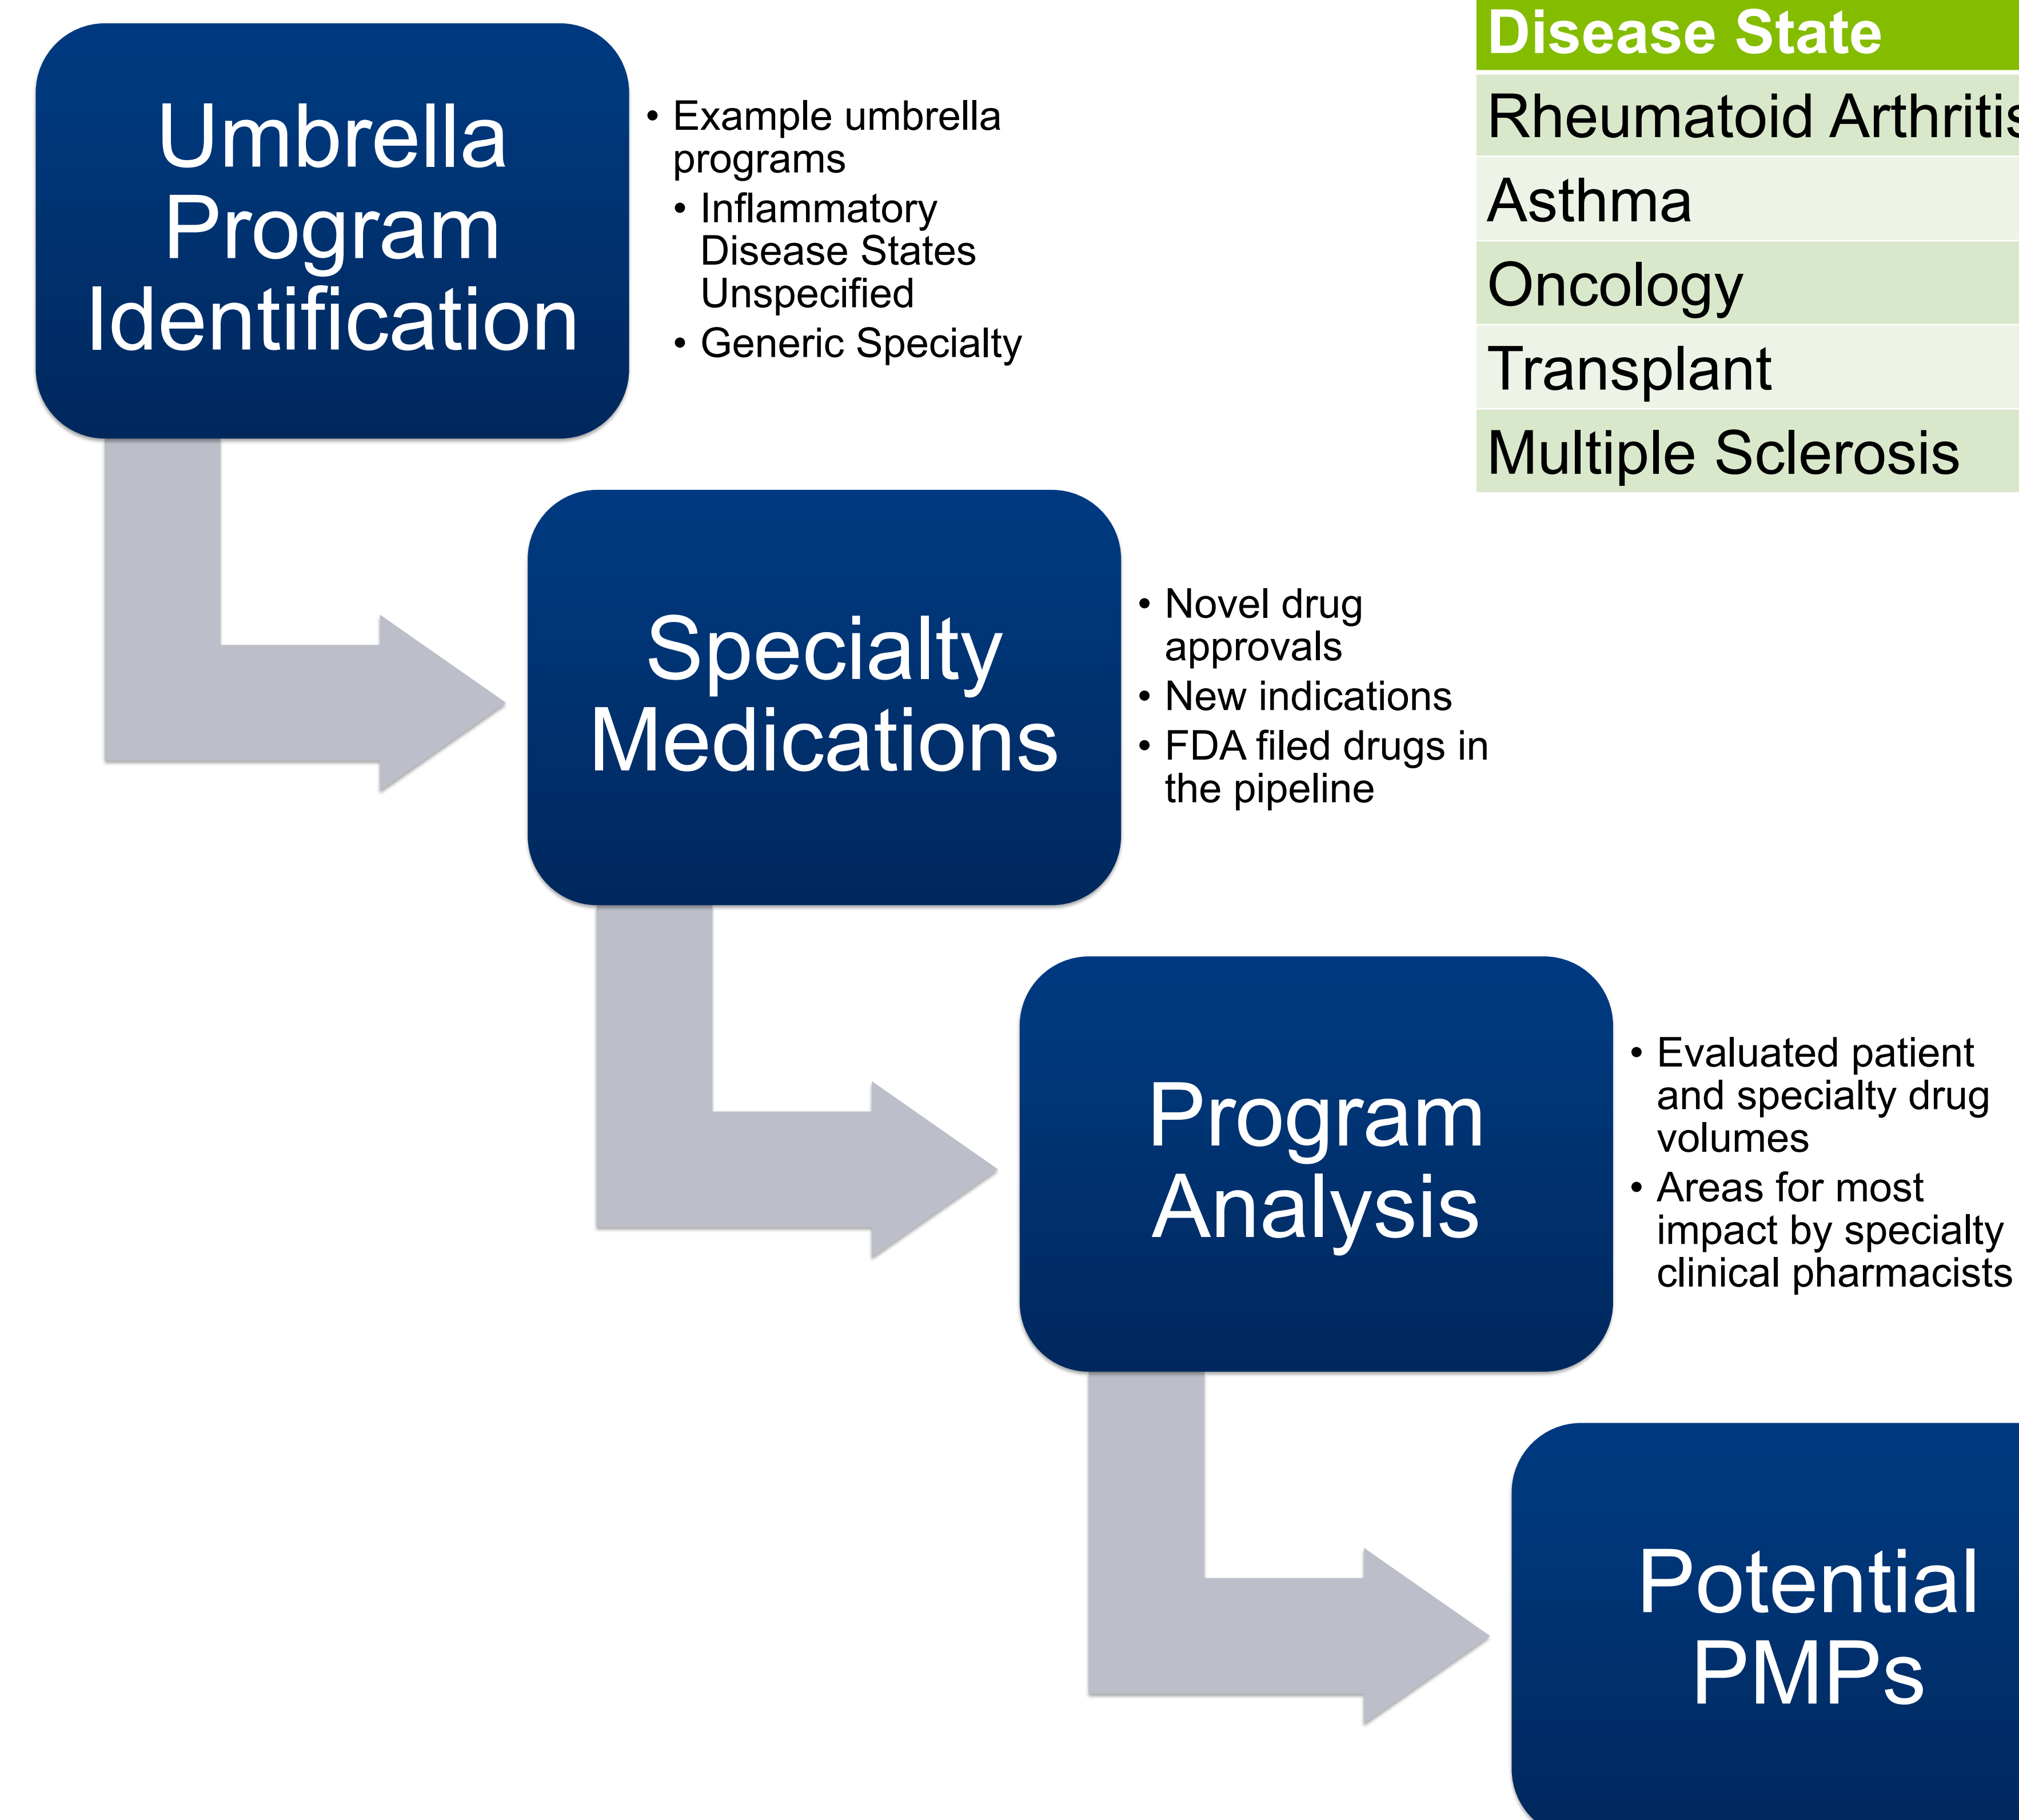

Figure 3: Therapeutic Goals

Disease State	Therapeutic Goal
Rheumatoid Arthritis	RAPID-3 score
Asthma	ACT
Oncology	Minimize toxicity
Transplant	Tacrolimus levels
Multiple Sclerosis	CDC-HRQOL

Discussion

- Analysis identified opportunities to provide more individualized patient care for specific disease states through PMP development.
- Established a formal, repeatable evaluation process to identify needs for PMP development.
- Evaluation of conditions in umbrella programs provided an opportunity to establish more specific PMP disease states with customized evidence-based therapeutic goals.

Limitations/Barriers

- Complex data analysis to identify disease area opportunities
- Limited staff resources
- Limited drug distribution access played a role in determining the development of a PMP disease state

Conclusion

- The systematic PMP development process ensured a consistent, data-driven approach to establish and expand disease-specific PMPs.
- With periodic evaluations of its PMPs, integrated HSSPs can easily meet the changing accreditation requirements, and payer expectations while providing evidence-based quality patient-centered care.

Future Directions

- Use electronic clinical pathways that incorporate PMP disease modules into the electronic health record
- Increase analysis of measurable patient outcomes
- Enhance processes for increased cost avoidance and reduction of medication waste
