

Collaborative initiative between health system specialty pharmacy and advanced heart failure program to identify patients with transthyretin amyloidosis

PRESENTER:
Anthony Donovan,
Ambulatory Pharmacist
Program Coordinator

BACKGROUND:

- ❖ Transthyretin amyloidosis (ATTR) is a rare disease that leads to progressive neuropathy and cardiomyopathy
- ❖ Timely diagnosis ATTR can be challenging due ineffective system-wide screening
- ❖ We describe an advanced heart failure program (AHFP) and health system specialty pharmacy (HSSP) collaboration to identify at-risk patients for ATTR

METHODS

- AHFP physicians, specialty pharmacy leadership, a pharmacist program coordinator, a nurse coordinator, and subject matter experts designed an algorithm and educational outreach activity
- ❑ HSSP created diagnosis code-based identification tool: 1) patients >40 years, 2) had an encounter at institution in past 2 years, 3) alive (on day of report), and all present:

 Bilateral Carpal Tunnel G56.03	 Neuropathy G60.* G62.* G63.* G64.*
 Spinal Stenosis M48: .00-.085.	 Cardiomyopathy I42.* I43.* I50.33 I50.30 I50.40 I50.41 I50.43 I50.9

- ❑ Identified patients were targeted with an educational activity directed towards their primary care physicians (PCP)
- ❑ The nurse coordinator instigated all outreaches to PCP and/or patients and scheduled follow up with advanced heart failure program for evaluation

Health system specialty pharmacies offer a unique role on multidisciplinary team-based approaches in the identification of patients at risk of ATTR

RESULTS

Next Steps & Opportunities

- Wider screening algorithm and incorporation of non-diagnosis code information
- Inclusive of non-cardiomyopathy patients
- Partnering with primary care and neurology
