

Migraine ACES: Assessing CGRP Efficacy and Safety

Ashley Zupancic, PharmD, BCACP; Amanda Hickman, PharmD, MPH, MSCS; Mark Kocin, CPhT

BACKGROUND

- The calcitonin gene-related peptide (CGRP) monoclonal antibodies used for migraine prevention and CGRP receptor antagonists for abortive migraine treatment are being more utilized for migraine management
- Though they have a similar mechanism of action, slight differences in their target may make dual therapy of these agents more effective in managing migraines with minimal concerns of increased safety risks
- Dual CGRP therapy could be a beneficial option for patients with contraindications, history of intolerance, or lack of benefit to other migraine medications

OBJECTIVES

The aim of the study is to assess the risk of adverse drug reactions resulting in therapy discontinuation when taking preventative and abortive dual CGRP agents compared to monotherapy

METHODS

Study Design: Multicenter double arm retrospective analysis

Patient Population: Ages 18 years and older

Setting: Integrated health-system specialty pharmacy

Timeframe: May 2019 – June 10, 2021

DATA COLLECTION AND ENDPOINTS

- Data was obtained from Arbor® specialty pharmacy technology platform which is utilized by all health system specialty pharmacies included in the study
- Data was organized into two arms including a monotherapy arm consisting of patients only ever actively on one CGRP and a dual therapy arm consisting of patients on an included preventative CGRP and one abortive CGRP agent concomitantly
- Descriptive statistics were utilized to analyze the collected data

RESULTS

THERAPIES DISCONTINUED DUE TO ADVERSE DRUG REACTION

INTERVENTIONS DUE TO ADVERSE DRUG REACTIONS (ADRs)

DISCUSSION AND CONCLUSIONS

CONCLUSION

ADDITIONAL CONSIDERATIONS

Strengths		
Limited evidence in literature	Large sample size (n=2,523)	National, multicenter population

Additional Considerations

- Further evaluation is needed to confidently conclude whether safety concerns exist when treating patients with dual CGRP therapy
- Future studies on trends and efficacy when using dual therapy are needed to further our understanding of these novel migraine treatments

FUTURE DIRECTIONS

- Investigate reasons for differences in adverse drug reactions between the arms
- Compare total number of all abortive medications used between comparator arms
- Assess efficacy of migraine management between the dual therapy group versus monotherapy group
